Geo-engineering is an umbrella term for deliberate climate intervention that includes spraying the sky with aerosols to reflect solar radiation away from Earth in order to cool the planet and to save the environment and humanity from the effects of supposedly man-made global warming. There is evidence that this program has already been implemented for many years using unidentified chemical aerosols, known as chemtrails.

A geo-engineering/ chemtrails experiment using a balloon to spray sulfur particles into the sky to reflect solar radiation back into space is planned for New Mexico within a year by scientist David Keith. Keith manages a multimillion dollar research [fund](#) for Bill Gates. Gates has also gathered a team of scientist lobbyists that have been [asking](#) governments for hand-outs to for their climate manipulation experiments with taxpayer money.

Geo-engineering is touted as a last-ditch effort to save people and the planet from global warming. But the truth is that geo-engineering can alter rain cycles leading to droughts and famine that could result in billions of deaths!

Therefore, Bill Gates appears to be using his concern over global warming to cloak his real intent of controlling weather and/or depopulation.

Mount Pinatubo Model for Geo-Engineering Drought, Famine & Death □

The Mount Pinatubo volcano in the Philippines erupted in 1991, spewing 22 million tons of sulfur dioxide (SO₂) into the upper atmosphere/stratosphere. A 2008 study from Rutgers University based a model on Mount Pinatubo sulfur dioxide (SO₂) emissions and applied it to geo-engineering; the scientists said that they expected overall global cooling, but some regions would experience an increase in greenhouse gases and warming, as was recorded after Pinatubo erupted.

Based on the SO₂ volcanic model, the scientists reported that geo-engineering aerosols sprayed in tropical or Arctic regions are likely to disrupt African and Asian/Indian summer monsoons, threatening the food and water supply for billions of people!

Additional negative consequences include ozone depletion, reduced strength of hydrological cycles resulting in decreased river flow and soil moisture.

While the scientists, led by Alan Robock, who performed the experiments appear to believe in man-made global warming, they do have stern warnings against the dangers of geo-engineering.

2012 Geo-Engineering Study

The Max Planck Institute conducted a study of geo-engineering models based on volcanoes, but the study was unrealistic because it used climate models with 400% more carbon dioxide than the pre-industrial era. However, their results showed that geo-engineering will cause a strong decrease in rainfall (a 15% loss in North America and Eurasia and a 20% decrease in South America). Overall, global rainfall would be reduced by 5%.

Unless one considers the financial benefits (government and private grants), it is bewildering why the academia would support geo-engineering.
